

## CHAPTER V

### CONCLUSION AND SUGGESTION

#### 5.1. Conclusion

The researcher found that Homelander is proven to have all nine signs of narcissistic personality disorder and is heavily influenced by it. NPD presents itself through a variety of different behavioral patterns. This condition has an effect on his interactions, relationships, and self-identity, resulting in manipulative tendencies, a lack of empathy, and an insatiable need for adulation. His inflated sense of self-importance, fixation with delusions of success, uniqueness, and entitlement to preferential treatment all add to his complicated psychological state. Homelander's behaviors demonstrate his arrogance, exploitation of others, and unwillingness to connect with their feelings and needs on a constant basis. NPD's widespread effects are visible in his pursuit of power, control, and validation, indicating the substantial influence this personality disorder has on shaping his behaviors and views.

#### 5.2. Suggestion

The researcher hopes that this study may provide answers to fans of The Boys and other films that tackle the topic of mental illness. The researcher suggests that society should take mental disorder more seriously. We must recognize the

significance of understanding mental illness, in this case narcissistic personality disorder, because there are still those who believe that mental illness is a joke or that it is not real. Empathizing with someone who has acted horribly is not the same as excusing the behavior. Understanding enables us to call our hatred into question and open our hearts. Narcissism is real. It needs to be dealt with. We should not demonize narcissistic persons, but rather help them in receiving proper treatment with open arms. The researcher acknowledges that this research is far from perfect, and the researcher believes that future researchers will be able to fill in the gaps and improve the research so that it can contribute to the growth of science, particularly psychology. Of course, the researcher hopes that this study will serve to support and/or supplement the work of other academics who are researching similar problems.
